

DataMover

Complete guide: installation, activation, features, troubleshooting

by Cristi Gordas

Guide updated for the current app version

1. What is DataMover

DataMover is a verified offload app for video production teams — copies files from video cards to multiple destinations at once (external drives, NAS, local folders), with integrity verification at every step.

What it can do

- Simultaneous copy to any number of destinations — all complete in parallel, not one at a time.
- Integrity verification, your choice: MD5, SHA-1, SHA-256, SHA-512, or size-only.
- Professional CSV + PDF reports, with color-coded status (OK / Mismatch / Error) and exact timestamps.
- Automatic resume on error (checkpoint) — continues where it left off, doesn't start over.
- Monitor Mode in the system tray — automatically detects inserted cards.
- Automatic card ejection after completion (Mac).
- Automatic folder naming: Date_Project_Card.
- Dark theme, full interface in Romanian, English, and Spanish.

Note: The source code is available on GitHub under the MIT license — but the compiled app needs an activation code, tied to your computer, to be able to start. See section 3.

2. Installation

macOS (recommended: .pkg)

Download DataMover-Mac-Installer.pkg from the Releases page. Double-click and follow the installer instructions — it removes the macOS quarantine automatically, nothing manual needed.

macOS (alternative: portable .zip)

Download DataMover-Mac.zip, unzip, move the .app wherever you want. If macOS refuses to open it ("app is damaged"), run:

```
xattr -rd com.apple.quarantine DataMover.app
```

Windows

Download DataMover-Windows.zip, unzip. Contains DataMover.exe, ready to run directly — no separate installation needed.

3. Activation

The source code is available on GitHub under the MIT license, but the compiled app needs an activation code to be able to start. Price: €9.80.

Step 1 — open the app

On first launch, the activation window appears automatically, with a Machine ID displayed right there — no need to run any separate command.

Step 2 — send me the ID

Copy the displayed ID ("Copiaza" button right next to it) and send it to me (Facebook or YouTube — see the last section of this guide), along with the €9.80 payment.

Step 3 — receive your code

I send you back your personal activation code, tied to exactly your computer — it won't work on a different machine, even if shared.

Step 4 — activate

Enter the code you received in the "Cod serial" field — once. After activation, the app starts normally every time, without asking for the code again.

Note: If you switch computers, you'll need a new code — just message me for that too.

4. Every feature, explained

Integrity verification

Choose the algorithm that fits your needs: MD5/SHA-1 are fast, SHA-256/SHA-512 are more rigorous (useful for long-term archiving). The "size-only" option is fastest, for situations where speed matters more than absolute certainty.

Automatic resume (checkpoint)

If a transfer is interrupted (card pulled, network error to NAS, etc.), DataMover resumes exactly where it left off on the next attempt — it doesn't re-send files already copied and successfully verified.

Monitor Mode

Runs in the system tray, automatically detects when you insert a new card, and notifies you — useful if you transfer often throughout a shoot day.

CSV + PDF reports

Every transfer generates a report with per-file status (OK / Mismatch / Error), useful for record-keeping and as proof the material arrived intact at its destination.

5. Common issues and solutions

macOS says the app is "damaged"

- Normal for unsigned apps — run `xattr -rd com.apple.quarantine DataMover.app` from Terminal.
- Or use the .pkg installer directly, which handles this automatically.

The activation code doesn't work

- Check that you copied it in full, with no leading/trailing spaces.
- A code is tied to ONE computer — if you switched machines, you need a new code.

The transfer stops halfway

- Check the connection to the destination (NAS/network) — DataMover automatically resumes where it left off on the next attempt.

6. License

DataMover's source code is MIT licensed — fully available on GitHub. Using the compiled app requires a personal activation code, €9.80, tied to one computer.
