

DataMover

Complete user guide

Version 2.7.2

English

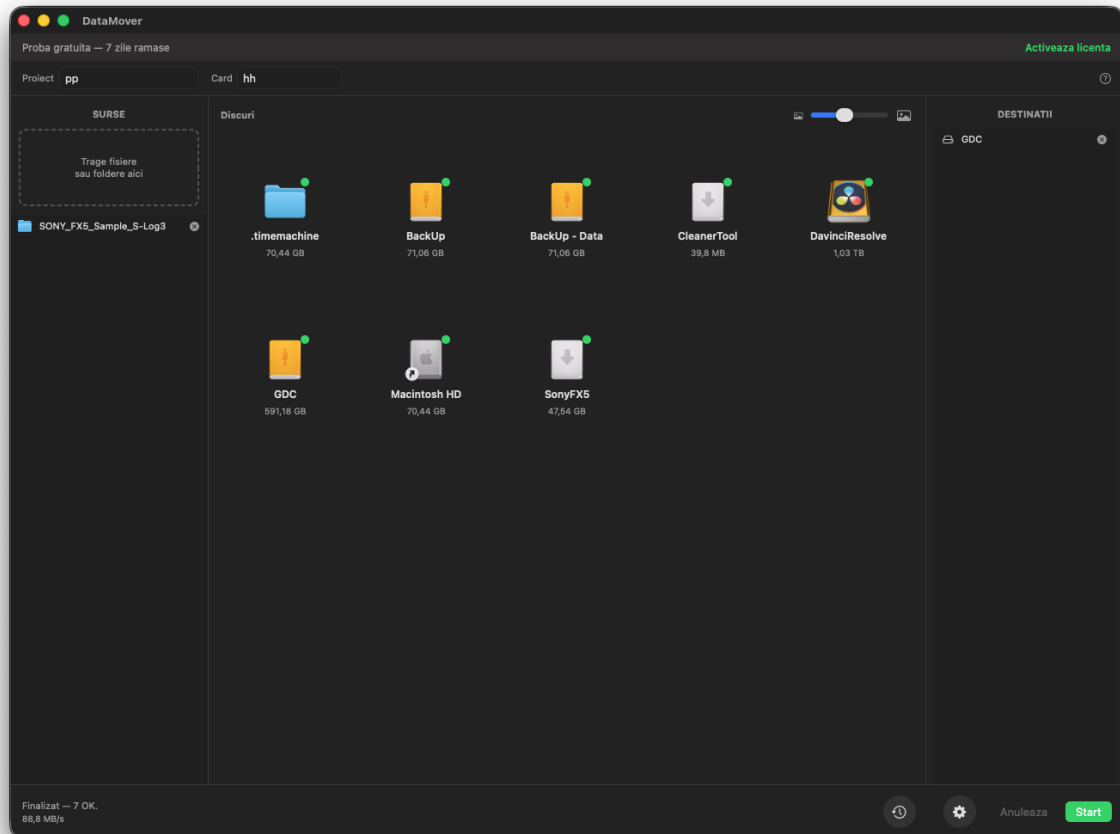

DataMover — User Guide

Install, activate, features, troubleshooting — by Cristi Gordas

Guide updated for the native macOS UI (SwiftUI) and the Windows app (WPF).

1. What is DataMover

DataMover is a verified offload app for video production teams — it copies files from video cards to multiple destinations at once (external drives, NAS, local folders), with integrity verification at every step.

Main window (Mac) — sources, detected drives, destinations

What it can do

- Simultaneous copy to any number of destinations — all complete in parallel, not one by one.
- Integrity verification, your choice: MD5, SHA-1, SHA-256, SHA-512, or size-only.
- CSV + PDF reports (table layout), with per-file status (OK / Mismatch / Error) and exact timestamp.
- Automatic resume on errors (checkpoint) — continues from where it left off, no full restarts.
- Copy history — see every past transfer, delete one entry or the whole history.
- Dependency panel 🟡/🟢 (Windows) — automatically checks system components needed by PDF reports.
- Automatic folder naming: Date_Project_Card.
- Built-in user guide inside the app (Mac).
- Light/Dark theme, your choice — full interface in Romanian, English and Spanish.

Note: the source code is available on GitHub under the MIT license — but the compiled app needs an activation code, tied to your computer, to keep running after the free trial. See section 3.

2. Installation

macOS

Download DataMover-Mac.zip from the Releases page, extract it and drag DataMover.app into /Applications.

On first launch, macOS may warn that the app is from an unidentified developer — normal for ad-hoc signed apps without a paid Apple Developer account. Right-click the app, choose Open, and confirm. One-time only.

Windows

Download DataMover-WPF-Windows.zip (new client, recommended) or DataMover-Windows.zip (classic client), extract it and run the installer — Add/Remove Programs uninstalls it cleanly when needed.

3. Activation

You get a 7-day free trial from first launch, with every feature unlocked. After the trial, the app needs a personal activation code to keep starting.

Step 1	Tap “Activate license” in the app's top bar — anytime, during the trial or after.
Step 2	The activation window shows your computer's ID (with a Copy button) and a green WhatsApp button — tap it to contact me directly, with the ID copied, to purchase.
Step 3	I send you back your personal activation code, tied exactly to your computer — it won't work on another machine, even if shared.
Step 4	Paste the code you received into the “License code” field and tap Activate. The app now starts normally every time, without asking for the code again.

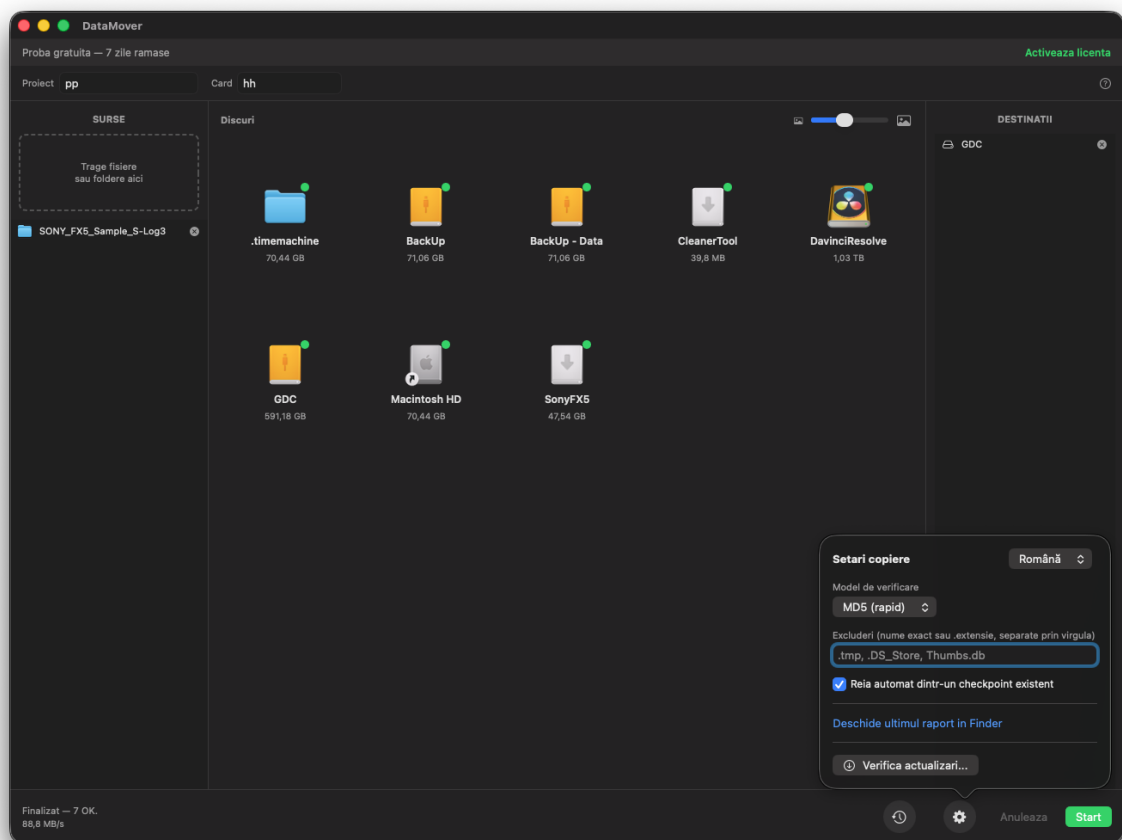

The 23 € is a donation, not a list price — it helps me cover development costs and keep maintaining and improving the app.

Note: if you switch computers, you'll need a new code — message me again on WhatsApp.

4. Features, explained

Integrity verification

Pick the algorithm that fits your needs: MD5 and SHA-1 are fast, SHA-256 and SHA-512 are more rigorous (useful for long-term archiving). “Size only” is the fastest option, for cases where speed matters more than absolute certainty.

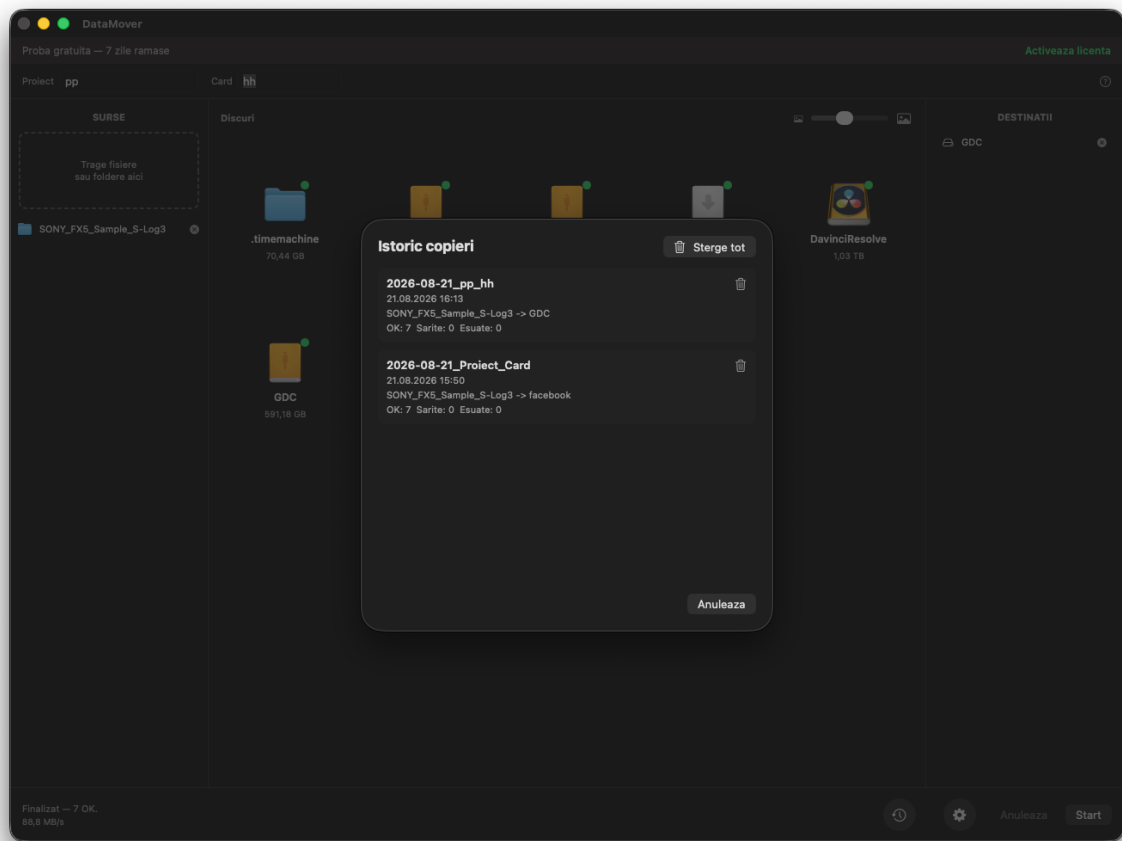

Copy settings — verification model, exclusions, buffer/RAM

Automatic resume (checkpoint)

If a transfer is interrupted (card removed, network error to a NAS, etc.), DataMover picks up exactly where it left off on the next attempt — it doesn't re-send files already copied and successfully verified.

Copy history

The clock button in the footer opens a window with every past copy job: date, folder name, source and destination, and OK/skipped/failed counts. You can delete a single entry or the entire history.

Copy history, with direct source/destination opening

● Dependency panel (Windows)

The “Profile” button in the footer shows a list of automatically checked system components, each with a **green** dot (present, all good) or a **red** one (missing). If you see red (for example the Visual C++ Redistributable, needed by PDF reports), tap the “Install” button next to it — it opens the official download page for that missing component directly. After installing it, tap “Recheck” in the same panel — no need to restart the app.

CSV + PDF reports

Every transfer generates a report with per-file status (OK / Mismatch / Error), useful for record-keeping and as proof the material arrived intact at its destination.

5. Common issues and fixes

macOS says the app is “damaged”

Normal for ad-hoc signed apps — right-click the app, choose Open, and confirm. If it still won't launch, run this in Terminal:

```
xattr -cr /Applications/DataMover.app
```

The activation code doesn't work

Check that you copied it completely, with no leading/trailing spaces. A code is tied to ONE computer — if you switched machines, you'll need a new code.

The PDF report is missing (Windows)

Check the indicator in the “Profile” panel (section 4 above) — if the Visual C++ Redistributable shows red, install it from there, then retry the transfer. The CSV report is always generated regardless of this indicator.

The transfer stops halfway

Check the connection to the destination (NAS/network) — DataMover automatically resumes from where it left off on the next attempt, if resume is enabled in settings.

6. License

DataMover's source code is MIT licensed — fully available on GitHub. Using the compiled app, after the 7-day free trial, requires a personal activation code (23 € donation), tied to a single computer.
